

FORKLIFT SAFETY:

Job #1 –The Essentials

1: FORKLIFT SAFETY AND TRAINING VIDEO AND DVDS

Forklift operators have a lot riding on their shoulders as far as safety is concerned. Companies should be doing everything in their power to make sure the operators are taking safety seriously. That is where forklift safety and training videos come in.

2: BATTERY SAFETY PRODUCTS

Forklifts require a lot of care and that's when battery safety products come in handy. Since most indoor forklifts are electric, it's important to ensure the batteries are in tip-top shape and watered on a regular basis. Also, since batteries contain acid, your company will want to have the proper eye wash station, personal protective equipment, watering devices and battery spill kit.

3: SEATBELTS

Since tip-overs are the number one cause of death from forklifts, seatbelt use is critical. OSHA enforces forklift seatbelt use through the General Duty Clause and other standards. **BUCKLE YOUR SEATBELT** for the ride.

4: EQUIPMENT CHECKLISTS

Part of forklift safety is ensuring every forklift is inspected before the start of each shift. That's where the checklist comes in. Be sure the lift truck is good to go.

THE CHOICE IS YOURS

These are just four of the many forklift safety essentials associated with forklifts. It's important for each company that uses forklifts to consider which forklift safety essentials might help them in their particular application.
