New Warehouse Management System

"There were many reasons why we chose WaveTrakWMS for our system needs. The most important were cost, the fact that the warehouse control system was PC based, the graphic capabilities of the software and the companies stability accompanied by their track record of successful installations."

"Before discovering WaveTrakWMS, we used to have a standard stockroom operation including shelving units, bins and 7,000 parts arranged in part number sequence. ***Within two weeks after installing the warehouse control system, we immediately more than doubled our productivity going from 250 lines per person to an average of 600 lines per person.***"

"Previously, our kitting accuracy was approximately 85%. Since the installation of a bar code system, we have shown dramatic improvement. By minimizing human intervention, we decreased errors and prevented the need for more people. Not only have we become paperless, but our accuracy of item upon pick is virtually 100%."

"The use of batching has allowed us to substantially increase our lines picked per person, per hour. Our average productivity measure indicates a capacity of 75-100 lines picked per person, per hour."

"We installed our first system in 1999. Although the system has evolved significantly, the core system has not changed and has continued to be extremely effective. We have been able to expand our system as we've needed to, with no problems at all."

"After determining the capabilities of WaveTrakWMS, we have a very high degree of confidence in both their product and the service they provide."
